

Custom and Mobile Application Development

Transform ideas into working applications

CareTech's Custom and Mobile Application Development services will provide you with access to development and strategy experts whose healthcare-only focus gives them the in-depth knowledge of the industry's best practices and innovations. Our experts will help you to assess your current clinical needs and business requirements, and come up with working application solutions.

Custom Application capabilities include:

Accountable Care Organization (ACO) Quality Metrics Data Processing

Allows you to continuously track patient care quality measures (exceeding the CMS-mandated measures) across your entire ACO population. Insights can then be gained from the data collected, to help improve the performance of the providers, ultimately improving the quality of patient care. The system uses business rules to guide data entry, which helps to ensure accuracy.

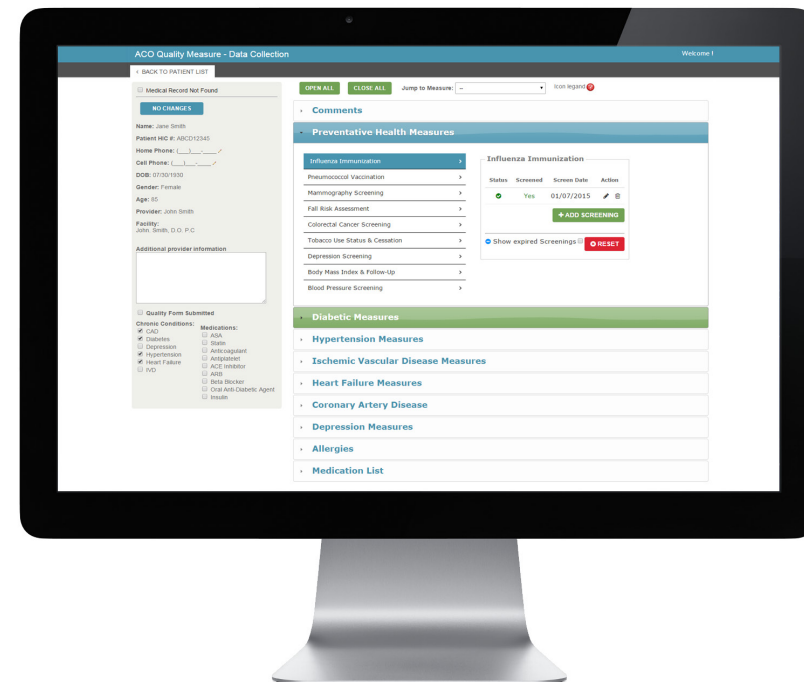

Physician Referral Services

Allows clinics and physician practices to refer patients to a hospital for clinical appointments, diagnostic and radiology services, and triage assessments. The system allows for communication between the call center and clinic administrators in order to complete all of the information sufficiently and schedule the appointment.

Winner of eHealthcare Leadership Awards

Best Patient Safety Communications - Accountable Care Organization (ACO) Quality Metrics Data Processing - 2015

Adult Pre-Surgery Registration

Enables patients to enter the necessary demographic and medical data in advance of their scheduled surgery. It also allows Pre-Admission Testing (PAT) the ability to schedule any required testing.

Interventional Radiology Magnetic Board

An electronic board that allows patients to be scheduled and managed throughout various departments and procedure rooms. The board displays the room, name of procedure, referring doctor, different stages of care, as well as relevant notes.

Physician Activity Reporting

A timekeeping system for physicians that enables hourly rates and vendor codes to be stored.

Mobile Application capabilities include:

Incident Reporting Tool

Allows physicians to easily record all information regarding Serious Safety and Near Miss Events from any location. The tool is integrated with the MIDAS system so that hospital administrators can have real-time access to the information, resulting in better and safer patient care.

Let our Custom and Mobile Application Development team assess your clinical needs and business requirements, and come up with a solution that works for you.
